xero

XERO × HELIUS

The agentic studio for Solana builders.

One desktop app. LanaAI on the inside. Helius on the wire. A friendly proposal from the Xero team for Mert and the Helius crew.

- local-first
- agent-native
- solana-maximalist

xero / squads-liquidator — agent run

fork	surfpool · mainnet-fork, 5 personas seeded	READY
build	tx pipeline · compute-budget + ALT	OK
inspect	lanaai · wallet flow + oracle risk	LIVE
land	helius sender · priority fee api	QUEUED
audit	idl drift · trident fuzz · exploit replay	CLEAN

78 solana_* commands, live today

1 surface for UI + autonomous runs

90 day pilot we're proposing

WHAT'S MISSING

Solana's tools are great. They just don't sit in the same window.

Helius and LanaAI each nail their layer. But the place where a builder's agent actually keeps context — repo, chain state, deploy safety, all in one loop — still isn't a product. That's the seam we want to close together.

EDITOR

Code + tests

Where the work starts, but the chain never quite arriv

TERMINAL

Validator scripts

Anchor, SPL, cargo build — each one in its own tab.

EXPLORER

Tx + wallets

Copy signature. Paste into browser. Ctrl+F th

DASHBOARD

RPC usage

01 **Context evaporates between tools.**

A tx fails in code. Moves to logs. Then to a browser. By the time the answer shows up, the agent has forgotten why it was asking.

02 **Local and mainnet feel like two products.**

You fork, seed, simulate, audit locally — then rewire everything to get reliable reads and confident sends on real infra.

03 **Every piece is its own invoice.**

RPC, explorer, indexer, deploy safety, cloud agents — five logins, five bills, five support threads. Velocity tax.

THE PRODUCT MOVE

One desktop app. Every step of the loop.

Xero / squads-liquidator · main

42mb · claude-opus-4.7

PROJECT

- src/
  - programs/
    - liquidator.rs
  - tests/
    - whale-flow.ts

WORKBENCH

- Personas
- Tx inspector
- Deploy safety
- Audit + replay

Surfpool mainnet-fork

slot 331,804,110 · 3,891 tps · 5 personas

ready

build	solana_tx_build — v0 tx + ALT hints	OK
simulate	auto CU 384k · fee percentile high	OK
inspect	lanaai — whale wallet + token flow	OK
gate	idl drift clean · squads authority ok	OK
send	helius sender · priority fee api	QUEUED

One loop

Code, fork, inspect, land, and audit — same run, no tab switching.

One surface

UI and autonomous agent call the same Tauri commands, same way.

One bill

Solana Pro bundles the infra spend builders already have.

LanaAI · LIVE

What did this whale do in the minutes before the failed liquidation?

Three related transfers. The failing tx writes to the same collateral PDA — looks like it's missing an oracle account.

Helius credits 62%

Auto top-up on. Public RPCs stay available as fallback for non-critical reads.

WHAT'S LIVE TODAY

This isn't a pitch for a workbench. The workbench is done.

Xero already has the Rust command surface, the mainnet-fork lifecycle, persona seeding, the tx pipeline, the audit engine, and the deploy gates — all wired through a Tauri app that ships as a single binary.

78

`solana_*` commands registered through the Tauri app today.

DESKTOP SUBSTRATE

Rust + Tauri core

React/Vite frontend, Rust backend, local SQLite journaling, ShadCN/Radix UI.

CLUSTERS

Local to mainnet-fork

Toolchain probes, managed installs, localnet + fork lifecycle, snapshots, cost ledger.

PERSONAS

Seeded actors

Whale, LP, voter, liquidator, new user — SOL/SPL/NFT funding receipts, scenario runs.

TX PIPELINE

Build, simulate, land

Priority fee tuning, compute-budget plans, ALT helpers, CPI resolver, Jito hooks.

DEPLOY SAFETY

IDL + upgrade gates

Codama gen, IDL fetch/publish/drift, upgrade checks, Squads proposals, verified builds.

SECURITY

Audit + replay

Static lints, Trident fuzz, coverage, exploit replay, PDA scans, secret detection.

Evidence: README, SOLANA_WORKBENCH_PLAN.md, client/src-tauri/src/lib.rs command registration, workbench source tree.

WHERE LANAAI PLUGS IN

LanaAI becomes the on-chain intelligence every run calls.

We don't want to wrap LanaAI. We want to give it a home inside the workflow builders already use — so a conversational explorer turns into the agent's working memory.

01 Tx inspector + decoder

After simulation or failure, Xero hands LanaAI the signature, logs, IDL, writable accounts, and persona context — and gets a plain-English trace back.

02 Audit + exploit replay

Before a risky deploy, the audit engine asks LanaAI for similar attack patterns, related account flows, and a short replay note humans can skim in 30 seconds.

03 Deploy-safety gate

Program upgrade checks query LanaAI for authority history, recent program activity, suspicious token flows, and IDL drift context — all before the button goes green.

04 Persona + scenario seeding

A builder describes a market, a wallet, an incident. Xero turns it into funded personas and a fork-ready scenario, with LanaAI filling in the on-chain context.

The upshot for Helius — every Xero Solana session becomes a LanaAI power session. Human prompts turn into agent loops. Agent loops multiply query volume.

ONE SUBSCRIPTION, INFRA INCLUDED

Make Helius the default paid rail inside Xero Solana Pro.

Free

$0 forever

Local desktop studio for builders bringing their own model + infra keys.

- Unlimited local projects
- Local autonomous runtime
- Bring your own model providers
- Discord + Telegram pings

Pro

$20 / month

Cloud runtime, sync, and durable background runs. Everything keeps moving while you sleep.

- Everything in Free
- Parallel workers · up to 16
- Hosted run history + replay
- Priority support

Solana Pro

BUNDLE

$50 / month

Pro plus the on-chain workbench — and Helius credits that Just Work from the app.

- Managed Helius RPC + Sender + Webhooks
- Hosted forks and reusable snapshots
- Deploy safety, Squads, verified builds
- Cost alerts, drift alerts, priority fee tuning

How the partnership works

Xero owns the subscription UX, metering, invoicing, and first-line support. Helius provides the infra rail and wholesale credit economics. One bill for the builder, clean accounting between us.

FOR BUILDERS

- Single invoice for app + Solana infra
- Automatic top-ups and cost panels
- Priority Fee + Sender + RPC + Webhooks
- Graceful public-RPC fallback

FOR HELIUS

- Paid acquisition at the point of creation
- Predictable wholesale volume
- Stickier daily workflow usage
- Path to dedicated nodes + enterprise

Xero pricing: landing/components/landing/pricing.tsx. Helius products: docs for RPC endpoints, Priority Fee API, Sender, Webhooks.

THE MOMENT

Agents don't use infra once. They use it on a loop.

The next Solana dev platform isn't a dashboard. It's an environment where an agent reads, simulates, explains, lands, and watches — over and over, all day long.

6,000 active Solana developers reached in 2025

3,830 new developers joined the ecosystem in 2025

10× query multiplier when agents drive exploration instead of humans clicking

Why this window is unusually good

LANAAI	A conversational Solana explorer is live today — exactly the integration surface agentic dev sessions need.
AGENTS	Coding agents are graduating from chat helpers to persistent workers that need reliable reads and tx landing.
LOCAL-FIRST	Serious builders want forked state, seeded scenarios, fast simulation, and safety checks before mainnet spend.
HELIUS	You already own the trusted infra layer: RPC, Sender, LaserStream, Webhooks, DAS, priority fees.
XERO	We sit at the daily point of creation — repo, agent, tooling, notifications, emulators, and now the Solana workbench.

PILOT + GO-TO-MARKET

Ninety days. A beta cohort. Real numbers on the table.

How the money works

Xero SaaS	$0 · $20 · $50
Helius credits	wholesale or rev-share
Team plans	seats + pooled credits
Enterprise	dedicated nodes + support
Future	MCP tool-surface licensing

Simple principle: Xero covers the app, Helius covers the infra. Nobody asks the other for freebies. Wholesale pricing makes the bundle fair.

WEEKS 0-2

Agree the shape

Scope LanaAI calls, credit metering, Helius account linking, privacy boundaries, and who owns support for what.

WEEKS 3-5

Ship the pilot

Embed LanaAI tx inspection, Helius credit ledger, Sender path, and priority fee defaults — all behind a beta flag.

WEEKS 6-8

Run with builders

Invite top Solana teams. Watch agent query volume, landing quality, workflow retention, and credit conversion.

WEEKS 9-12

Co-launch

Docs, examples, demo day. A co-branded Solana Pro beta launch, powered by Helius and LanaAI.

Pilot target: 500 qualified builders · 300 Solana Pro seats · $180k ARR run-rate · 3× lift in Helius credit consumption from the Xero cohort.

A QUICK, HONEST PITCH

Mert — LanaAI changes how people *explore* Solana. The next fight is over where they spend their eight hours a day actually building on it.

We're not trying to compete with Helius. We want Xero to be the reason every serious Solana builder has a Helius account open and asks LanaAI something new every day.

01 **Distribution, at the point of creation**

Helius moves from an infra dashboard to the default rail inside the builder's repo, tx pipeline, and deploy gate.

02 **Agents are a volume multiplier**

Agents don't ask one question. They inspect on a loop — accounts, logs, fees, histories, risks, landings. All on your infra.

03 **Local-to-mainnet flywheel**

Xero starts free and local. When reliability, speed, Sender, and webhooks start mattering — teams graduate straight into Helius.

04 **Shared DNA**

Local-first craft. Solana-native bias. Honest about infra tradeoffs. Preference for tools builders actually use every day.

START SMALL, SHIP TOGETHER

A focused 90-day technical pilot. Nothing more than that to start.

01 **Technical pilot**

LanaAI integration surface, Helius account linking, credit metering, Sender + priority-fee defaults.

02 **Wholesale pricing**

Clear credit economics for Solana Pro, Team, and enterprise tiers — no one asking anyone for freebies.

03 **Co-branded launch**

"Powered by Helius and LanaAI" inside Xero Solana Pro — joint docs, demos, and launch content.

04 **Builder intros**

Run the pilot with top Solana teams who will stress the workbench and produce credible usage data.

05 **Upside — when it's earned**

Equity, rev-share, or strategic distribution — a conversation for after the pilot proves demand.

NEXT STEP

A 30-minute call this week.

We'd scope the LanaAI hooks, credit metering contract, and the beta cohort. We'll bring the full Solana Workbench plan and command surface.

Ready when you are, Mert →
