xero

XERO × HELIUS

The desktop studio Solana builders live in.

Helius for Agents in the harness. Lana as the explorer tab. One desktop, one bundle, one build loop.

- helius for agents · embedded
- lana · explorer tab
- wholesale rpc + sender

xero / squads-liquidator • agent run

fork	surfpool · mainnet-fork, 5 personas seeded	READY
simulate	solana_simulate · compute + alt + priority fee	OK
explain	helius mcp · parse_tx → lana tab opens trace	LIVE
land	helius sender · solana_tx_send	QUEUED
audit	solana_audit_static · trident fuzz · replay_exploit	CLEAN

79 solana_* commands registered today

24 already wired into the agent harness

90 day pilot we're proposing

WHAT'S MISSING

Solana's tools are great. They just don't sit in the same window.

The rail, the explorer, the MCP servers — all shipped. The place a builder's agent *lives* isn't.

01

editor → logs → explorer → docs

Context dies between tabs.

Code → logs → explorer → docs. By the time you find the answer, the agent forgot the question.

02

localnet ↔ mainnet

Local and mainnet feel like two products.

Fork and seed locally, then rewire everything for real reads and sends. Two worlds, one builder.

03

rpc · explorer · indexer · deploy · agents

Five vendors, five invoices, one tired dev.

RPC, explorer, indexer, deploy, agents. Five logins, five bills — a velocity tax paid daily.

WHAT XERO IS

A desktop IDE built for Solana.

Code, fork, simulate, replay, deploy — in one window.

01 **Local-first, Tauri-native**

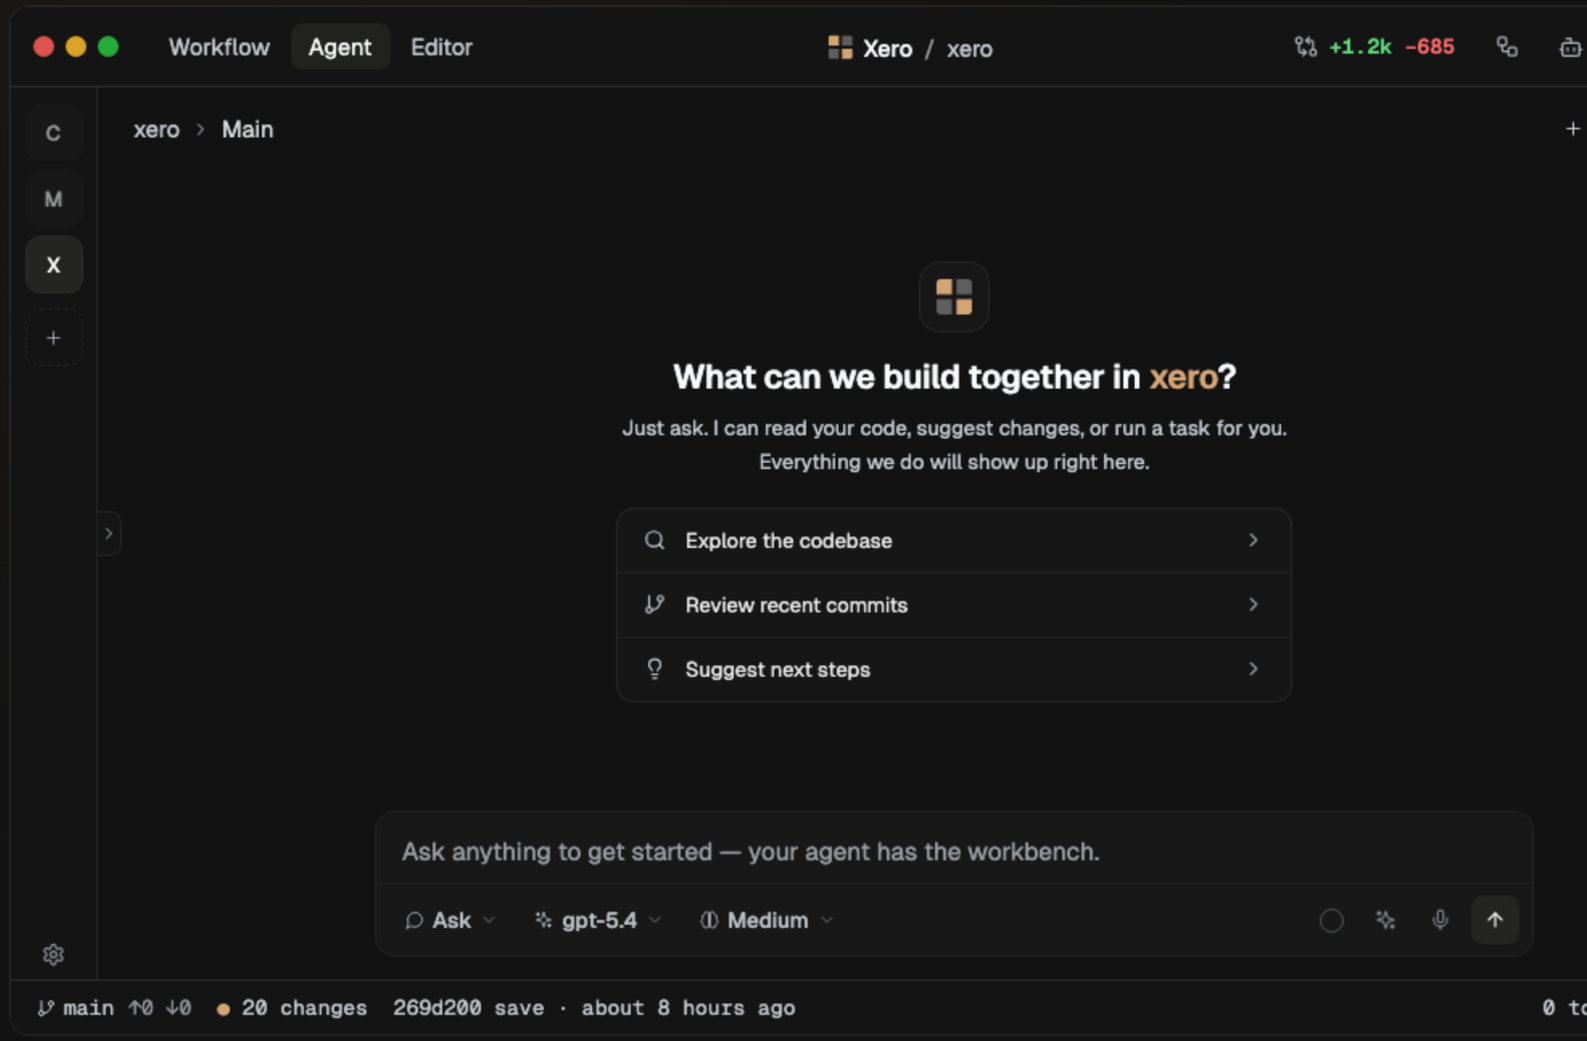
Rust + Tauri v2. Keys in the keychain, state in SQLite + LanceDB. No cloud session to babysit.

02 **Agents share the builder's tools**

79 `solana_*` commands · 24 already mounted as agent tools. MCP plugs in alongside.

03 **Solana-native, not bolted on**

Forks, personas, IDL drift, Squads, verified builds, Trident fuzz, exploit replay — built in.



WHAT'S LIVE TODAY

This isn't a pitch for a workbench. The workbench is done.

Command surface, forks, personas, tx pipeline, audit, deploy gates — shipped. 24 already mounted as agent tools.

79

`solana_*` commands registered — 24 already mounted as agent tools. A ready-made surface for Helius MCP and Skills.

SUBSTRATE

Rust + Tauri v2 core

React 19 / Vite UI, Rust backend, SQLite + LanceDB project stores, ShadCN/Radix throughout.

CLUSTERS

Local → mainnet-fork

Toolchain probes, managed installs, Surfpool fork lifecycle, snapshots, cost ledger.

PERSONAS

Seeded actors

Whale, LP, voter, liquidator, new user — funded keypairs ready for scenario runs.

TX PIPELINE

Build · simulate · land

Priority-fee estimator, compute-budget, ALT helpers, CPI resolver — already pointing at Helius RPC.

DEPLOY SAFETY

IDL + upgrade gates

Codama gen, IDL drift, Squads proposals, verified builds, rollback path.

SECURITY

Audit + replay

Trident fuzz, coverage, exploit replay, PDA scans, Helius-key secret detection.

Evidence: src-tauri/src/lib.rs (79 solana_* commands) · autonomous_tool_runtime/solana.rs (24 agent tools) · solana-workbench-sidebar.tsx (13 tabs).

WHERE HELIUS PLUGS IN

Helius for Agents fits the harness like a missing tooth.

You shipped the stack. We shipped the harness. Bolting them together is wiring, not research.

01 Helius MCP mounted as native tools

Your 60+ MCP tools load next to our 24 `solana_*` tools through Xero's MCP registry. One namespace, one approval surface.

02 Helius Skills as first-class project skills

Xero already discovers project skills. Helius Skills drop in unchanged, with "Powered by Helius" attribution in the planner.

03 RPC, Sender, Priority Fee on by default

In the Solana bundle, every simulate / send / replay routes through Sender + Priority Fee by default. Wholesale credits, predictable volume.

04 Lana embedded as the 14th workbench tab

13 workbench tabs, then Lana. A partner explorer next to your rail — every query still a Helius read underneath.

FREE FOREVER · SOLANA, OPTIONAL

Helius becomes the default rail inside the Xero Solana bundle.

Free

• COMING SOON

$0 forever

Full app. Every feature, every provider, BYO keys. No trial timer.

WHAT'S INCLUDED

- Custom agents · tools, memory, stage gates
- Ask, Engineer, Debug, Agent Create built-in
- 11 model providers · BYO keys
- Branch, rewind, compact, handoff, rollback
- MCP server registry · Helius MCP loads here

Solana Bundle

HELIUS INSIDE

$50 / month

Optional. One sub for what builders usually pay 4–5 vendors for. Helius credits underneath.

WHAT'S INCLUDED

- Helius RPC, elevated rate limits
- Sender + Priority Fee API by default
- Webhooks, DAS, LaserStream credentials
- Helius MCP + Skills loaded, attributed
- Lana tab · Squads + verified-build gates

Clean split. One bill for the builder.

Xero owns the app, UX, metering, billing, support. Helius owns the rail and wholesale credit economics.

FOR BUILDERS

- One invoice for app + Solana infra
- Auto top-ups and cost panels
- Priority Fee + Sender + RPC + Webhooks
- Graceful public-RPC fallback

FOR HELIUS

- Paid acquisition at the point of creation
- Predictable wholesale credit volume
- Daily-active stickiness vs. dashboard drop-ins
- Direct upsell path to dedicated nodes

90-DAY PILOT

Ninety days. Bolt the two halves together.

Helius for Agents in the harness, Sender routed under the bundle, Lana inside the workbench — behind a beta flag, in front of a small cohort.

WEEKS 0-2

Agree the shape

Scope MCP mounting, Skills attribution, credit metering, support handoff, and the Lana embed contract.

WEEKS 3-5

Ship the pilot

Mount MCP. Load Skills. Default Sender + Priority Fee. Add Lana tab. All behind a beta flag.

WEEKS 6-8

Run with builders

Invite a small cohort. Instrument tool-call volume, landing quality, retention, and credit usage — share the dashboard both ways.

WEEKS 9-12

Co-launch

Joint docs, demos, co-branded beta. *Powered by Helius* on the bundle.

DONE WHEN

- **Helius MCP + Skills** load by default in the bundle, with attribution
- **Lana** ships as the 14th workbench tab
- **Sender + Priority Fee** are the default rail for every build, simulate, and send
- **Joint launch** content out — docs, demo video, co-branded post

A QUICK, HONEST PITCH

Mert — you shipped the agent stack. The next fight is owning the place builders spend eight hours a day calling it.

We're not here to compete. We want Xero to be why every serious Solana builder loads your MCP, Skills, and rail by default.

01

Distribution at the point of creation

"Available to install" becomes "loaded by default" inside the repo, tx pipeline, and deploy gate.

02

Agents are a volume multiplier

Agents loop — accounts, logs, fees, histories, landings. Every loop is an MCP call and an RPC read.

03

Free-to-paid flywheel built in

Free and local to start. When reliability and Sender start mattering, teams graduate into the Helius bundle.

04

Shared DNA

Local-first. Solana-native. Built for builders who'd notice if either of us got lazy.

START SMALL, SHIP TOGETHER

A focused 90-day pilot. Nothing more to commit to up front.

01 **Helius for Agents, loaded by default**
Permission to embed MCP, Skills, and the Claude Code plugin with full attribution.

02 **Wholesale Helius pricing**
Credit economics for RPC, Sender, Priority Fee, Webhooks — so the bundle pays for itself on day one.

03 **Co-branded launch**
"Powered by Helius" on the bundle. Joint docs, demos, launch content. Lana attribution stays with Lana.

04 **Builder intros**
5–10 top teams to stress the workbench and produce credible usage data.

05 **Upside — once it's earned**
Equity, rev-share, or strategic distribution. After the pilot proves demand.

• NEXT STEP

30 minutes this week.

Live walkthrough: harness mounting Helius MCP, 13 workbench tabs + sketched Lana tab, and the credit-metering contract.

Ready when you are, Mert →
